

# Basic Compiler Optimizations:

## Question 1:

The optimizations are listed below:

1. Common subexpression elimination
2. Copy propagation
3. Invariant code motion
4. Strength reduction
5. Test Elision and Induction Variable Elimination and
6. Constant Propagation and Dead Code Elimination

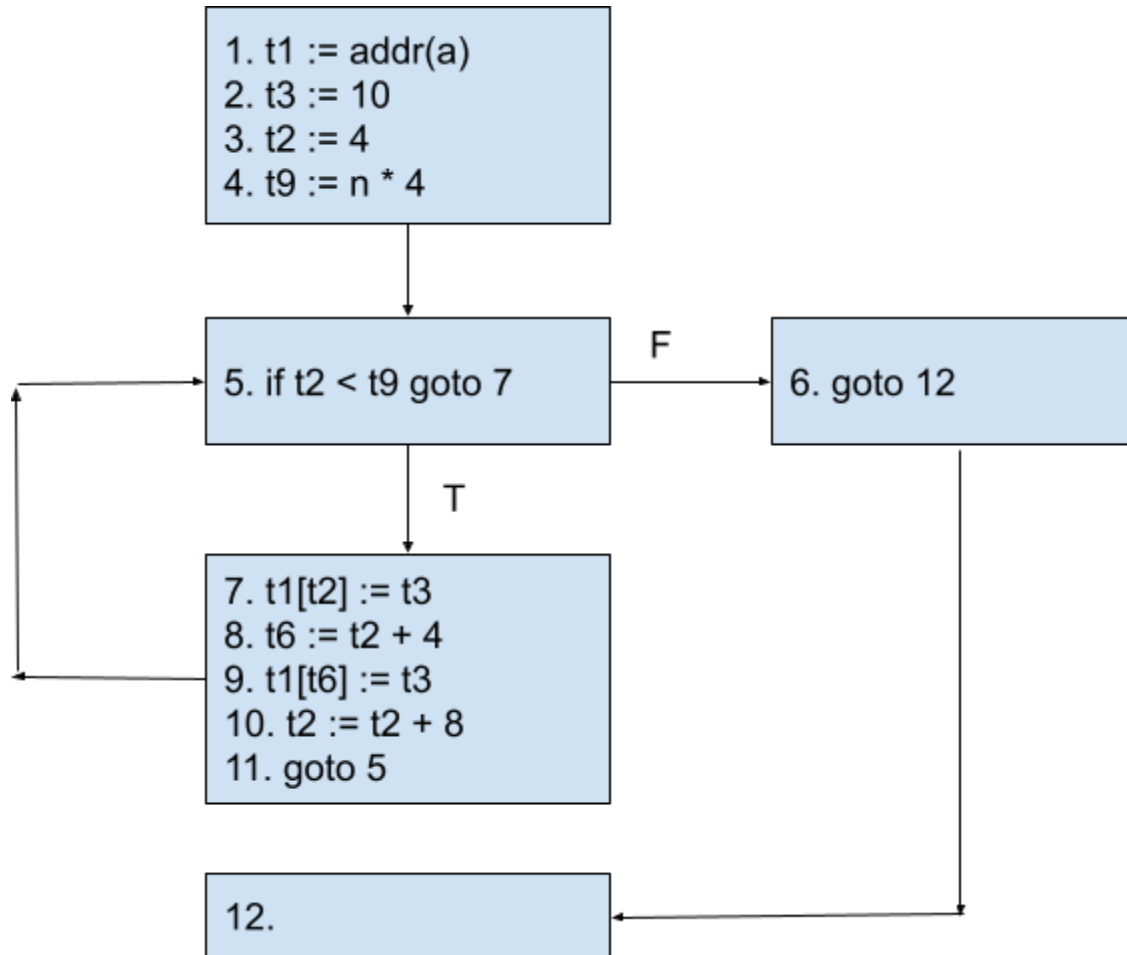

## Question 2:

The optimized code after applying the optimizations listed above.

1. `t1 := addr(a)`
2. `t3 := 10`
3. `t2 := 4`
4. `t9 := n * 4`
5. `if t2 < t9 goto 7`
6. `goto 12`
7. `t1[t2] := t3`
8. `t6 := t2 + 4`
9. `t1[t6] := t3`
10. `t2 := t2 + 8`
11. `goto 5`
- 12.

### Question 3:

The CFG of the optimized code is attached below.

## Dataflow Frameworks:

### Question 1:

- a) The property set is the lattice of all subsets of the variables in the problem. As it is a may problem,  $\leq$  is the subset operation. 0 is the empty  $\{\}$  set and 1 is the universal set.  
Join is the set union operator.

- b) Transfer functions:  $\text{in}(j) = \text{gen}(j) \cup (\text{out}(j) - \text{kill}(j))$   
 $\text{out}(j) = \{ \cup \text{in}(i), i \text{ is successor of } j \}$

$\text{gen}(j) = \{\text{all the variables in the expression that means the variables in the both left and right side}\}$

$\text{kill}(j) = \{\}$  because used or defined actually does not kill any variables.

For example, for the expression,  $j: x=y+z$ ,  $\text{gen}(j)=\{x, y, z\}$ ,  $\text{kill}(j)=\{\}$

- c) The initial value of the extremal node is  $\{\}$ . The initial values of the other nodes are  $\{\}$  also.

**Question 2:** A. True

**Question 3:** B. False

**Question 4:** A. MFP = MOP

**Question 5:**

No, the answer would not be safe to use for program transformation because some information is being lost. For example, in Reach problem, some definition  $(x,k)$  does not reach a node when in fact it reaches the node.

## RTA, XTA, PTA and Context Sensitivity:

**Question 1:**

For  $l.\text{evaluate}()$ :

$\{\text{ConstExp.evaluate}(), \text{VarExp.evaluate}(), \text{OrExp.evaluate}(), \text{AndExp.evaluate}()\}$

For  $r.\text{evaluate}()$ :

$\{\text{ConstExp.evaluate}(), \text{VarExp.evaluate}(), \text{OrExp.evaluate}(), \text{AndExp.evaluate}()\}$

## Question 2:

For l.evaluate():

{ConstExp.evaluate(), VarExp.evaluate(), OrExp.evaluate(), AndExp.evaluate()}

For r.evaluate():

{ConstExp.evaluate(), VarExp.evaluate(), OrExp.evaluate(), AndExp.evaluate()}

## Question 3:

For l.evaluate():

{ConstExp.evaluate()}

For r.evaluate():

{VarExp.evaluate(), OrExp.evaluate()}

## Question 4:

The points-to graph is given below.

**Question 5:** o3, o1

**Question 6:** o3

## Question 7: o3

# Abstract Interpretation:

## Question 1:

The constants abstraction defined in the class is:

- 1)  $\alpha(c) = \perp$  if  $c = \{\}$
- 2)  $\alpha(c) = \underline{n}$  if  $c = \{n\}$
- 3)  $\alpha(c) = T$  otherwise
- 4)  $\gamma(T) = Z$
- 5)  $\gamma(\underline{n}) = \{n\}$
- 6)  $\gamma(\perp) = \{\}$

1. We know that,  $\alpha$  and  $\gamma$  form a Galois connection, if for every  $a \in A$  and every  $c \in C$ ,  
 $c \subseteq \gamma(a)$  iff  $\alpha(c) \leq a$

Now, for these constants abstraction we can write,

If  $c = \{\}$ , then for every  $a$ ,  $\{\} \subseteq \gamma(a)$  and  $\alpha(\{\}) \leq a$ .

If  $c = \{n\}$ , then  $c \subseteq \gamma(a)$  or  $\alpha(c) \leq a$  for  $a = \underline{n}$  or  $a = T$ .

If  $c$  is any other set, then  $c \subseteq \gamma(a)$  or  $\alpha(c) \leq a$  for  $a = T$

So, we can say  $\alpha$  and  $\gamma$  form a Galois connection.

2. Now we can show,  
 $\alpha(\gamma(T)) = \alpha(Z) = T$   
 $\alpha(\gamma(\underline{n})) = \alpha(\{n\}) = \underline{n}$   
 $\alpha(\gamma(\perp)) = \alpha(\{\}) = \perp$

That proves that  $\alpha(\gamma(a)) = a$  for all  $a$ .

So, we can say that the constants abstraction is a Galois insertion.

**Question 2:** A. True

**Question 3:** B. False

## Types:

**Question 1:**

Define factorial = fix  $\lambda f. \lambda x. \text{if } (\text{iszero } x) \ 1 \ (\text{times } x \ (f \ (\text{pred } x)))$

Where,

times = fix  $\lambda f. \lambda x. \lambda y. \text{if } (\text{iszero } x) \ 0 \ (\text{plus } y \ (f \ (\text{pred } x) \ y))$

plus = fix  $\lambda f. \lambda x. \lambda y. \text{if } (\text{iszero } x) \ y \ (f \ (\text{pred } x) \ (\text{succ } y))$

**Question 2:**

let factorial n = if n == 0 then 1 else n\* factorial (n-1)

**Question 3:**

- a)  $[\text{Int} / t_0, \text{Int} \rightarrow \text{Int} / t_1]$
- b)  $[t_0 / t_1, t_0 / t_2, t_3 \rightarrow t_4 / t_0]$
- c)  $[\text{Int} / t_0, \text{Int} / t_1]$
- d) No principal unifier exists.

**Question 4:**

$(t_1 \rightarrow t_2 \rightarrow t_3) \rightarrow (t_1 \rightarrow t_2) \rightarrow t_1 \rightarrow t_3$

## Question 5:

A. The type is, `int -> int`

## Question 6:

B. Because `z` comes from outer scope and may not be polymorphic.

## Question 7:

a) YES.

b)  $(((((t_0 \rightarrow t_0, t_0 \rightarrow t_0), (t_0 \rightarrow t_0, t_0 \rightarrow t_0)), ((t_0 \rightarrow t_0, t_0 \rightarrow t_0), (t_0 \rightarrow t_0, t_0 \rightarrow t_0))), (((t_0 \rightarrow t_0, t_0 \rightarrow t_0), (t_0 \rightarrow t_0, t_0 \rightarrow t_0)), ((t_0 \rightarrow t_0, t_0 \rightarrow t_0), (t_0 \rightarrow t_0, t_0 \rightarrow t_0))))))$

c) It will increase the complexity of the program exponentially. I ran the haskell representation of the code in haskell and it got kind of stuck. It should return  $2^{10}$  pairs.
